

Press Release

vms-profound

FOR IMMEDIATE RELEASE
January 10, 2007

Profound's IS-liquid leveling system installed in New York City.

Last year Profound added to their Intelligent Sensor (IS) geotechnical monitoring system the fully renewed IS-liquid leveling system, an effective tool for precision monitoring of settlements. Recently this system was installed to monitor the 59th St/Lexington Subway Station in New York City, USA, and as part of the same project the system will also be installed in two additional tunnels in the first half of 2007, incl. the Shuttle tunnel near New York's Grand Central station.

Peter Middendorp, President of Profound, commented that "Having access to reliable data is vital on any monitoring project, whether in Europe or North America. With the advanced Profound IS-system you can effectively manage your instrumentation data on site, wherever you are."

Gerald Verbeek, President of VMS-Profound, added that "After the installation of several of these liquid leveling systems in Europe, this first project in the USA demonstrates that Profound can bring innovative solutions in the area of geotechnical monitoring anywhere in the world."

Profound will be pleased to discuss your particular monitoring requirements and provide you with the opportunity to experience the best practical monitoring solutions the industry can offer.
